Our work on Mexican election regulation

Before: Party watchdog model, congressional parties delegate

- Expect party segmentation of IFE's Council General
- Ideal point estimation confirms

Now: longitudinal approach to study councilor drift
1996–2014

- New puzzles emerge

→ Key pieces of the structure of delegation missing in Mexico:

- ① Multi- vs. two-party system
- ② Constant mutation vs. stability
- ③ Younger vs. mature bureaucrats

How do IFE and parties relate?

From <http://reforma.com.mx> 8/29/2007

- Nine-member, non-partisan regulatory board
- Ran federal elections nationwide 1997–2012, esp. PRI's defeats
- Congress appoints members by super-majority for 7-year terms
- Public roll call votes
- Upgraded in 2014 to also regulate subnational races (INE)

IFE's success story: conventional arguments

- IFE as *ombudsman* representing citizens directly
(Eisenstadt 2004, Ackerman 2004)
- Budget and tenure security
- Congressional appointment yet no inevitable bias in experts
(Schedler 2000, Woldenberg 2008)

Independence + impartiality → citizen trust

Public opinion

	% trust
Church	72
IFE	67
Army	65
Congress	35
Parties	34

Reforma poll May 2005

Reforma poll May 2005

Congressional parties (principal) structure a referee (agent) that they can influence

High stakes: IFE has authority over every aspect of party life

- voter registration
- allocates TV spots
- redistricting
- campaign finance
- nominations
- who clears subsidy hurdle
- campaign content
- ...

Careful delegation → **party** trust → citizen trust

Contract design (Kiewiet & McCubbins 1991)

- Screening
 - formally non-partisan
 - super-majority rule
- Monitoring
 - party reps in board and committees
 - constant signalling
- Carrots/sticks
 - routine impeachment threats, some took place
 - budget cuts
 - nuclear option (electoral reform)
- Checks and balances
 - split in thirds
 - electoral tribunal

How do 3 instead of 2 parties affect delegation?

- Party quotas and veto system used (informal) → power-sharing
- Collective principal appoints a collective agent
- Common solution in other 'autonomous' regulatory boards (telecomm, energy, education...)

Unstable environment

What if the principal goes out of business?

U.S. has inherited some of this

Stochastic spatial voting

Vote propensity: $v_j^* = \text{signal}(x_j - m) + \text{error}$.

Voting is sincere: $v_j = \begin{cases} 1 \text{ ('aye')} & \iff v_j^* \geq 0 \\ 0 \text{ ('nay')} & \text{otherwise.} \end{cases}$

Small assembly: Bayesian estimation via MCMC simulation.

Approach 1—Martin&Quinn (2002):

- For **quarter** t : $x_{j,t} \sim N(x_{j,t-1}, \text{slack})$
- *Drawback*: votes vary considerably across quarters—ideal points sensitive to sheer volume of information (Desposato), so drift may be spurious

Approach 2—Bonica (2010):

- Allow estimates to vary over periods of very short duration: item $i \pm k$, $k = 15$
- **Vote-by-vote** estimation
- Periods mostly overlap, constraining short-term shifts
- IRT instead of OC

Data = contested votes

Votes: 5,202 unanimous, 1,640 contested (24 %)

Same members within each period (I, II, ...)

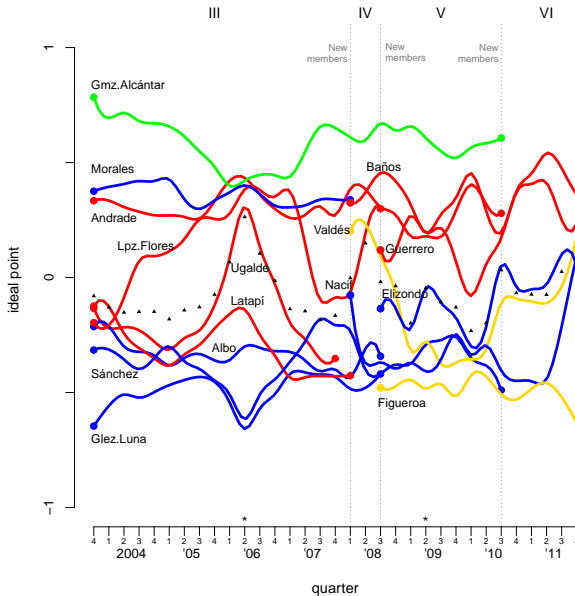

Results: 1996–2003 quarterly

Results: 1996–2003 vote-by-vote

Results: 2003–2011 quarterly

What lies behind drift?

<i>Type</i>	<i>Effect on ideal points</i>
1. Screening	Concomitant shifts among same-sponsor councilors
2. Constituent pressure	Shifts should <i>follow</i> change in principal's situation (eg. new Congress)
3. Gatekeeping	Removal of divisive issues pulls most together

Some empirical indicators

- ① New Congress = new principal
- ② Congressional party split = two new principals
- ③ Election quarters = less agenda control by IFE (party complaints)

Party complaints filed as % of all votes

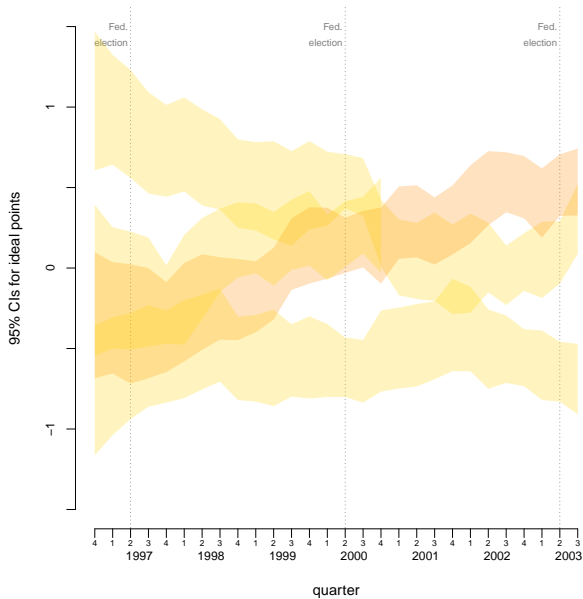

Results: overlapping

Results: overlapping

Results: overlap in two models

Results: overlapping

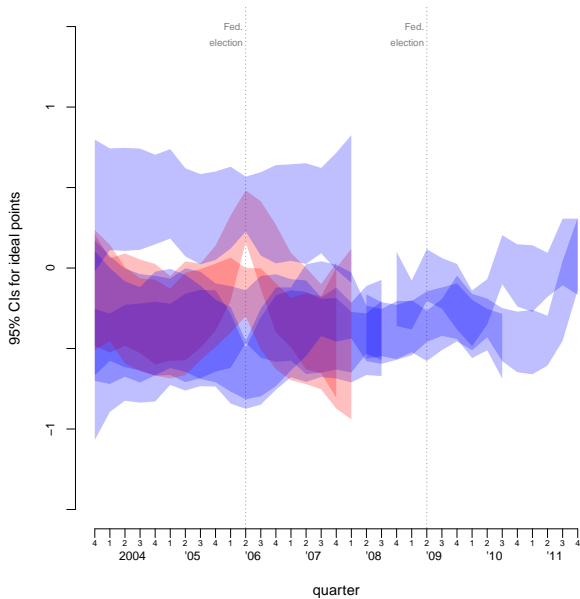

Results: overlapping

Results: overlapping

Results: overlapping

New principal and inter-quarter change

	Posterior $ x_{j,t+1} - x_{j,t} $	Mean	Std. dev.
a	New Congress quarters	.140	.115
b	Rest	.108	.084
c	Prob. a>b		.560

Gatekeeping and signal-to-noise ratio

	Posterior signal; _i	Mean	Std. dev.
d	Electoral quarters	2.677	1.682
e	Rest	2.601	1.684
f	Prob. d>e		.565

Posterior signal; _s with .95 ci off zero		
g	Percentage electoral quarters	53 %
h	Percentage rest	45 %

Party system influence

FIGURA 7. Porcentaje de votos promedio del PRI, PAN y PRD en distritos de mayoría relativa, 1997 – 2006.

Source: Aparicio&Márques (2010).

- ➊ Preliminary inspection shows some promising routes
- ➋ Ideal points in IFE move considerably. Short-term shocks and long-term drift
- ➌ Movement seems tied to representation considerations (change in principal; less agenda power)
- ➍ Next: kernel smoother; committee-plenary interactions

Thank you!
